

FREQUENCY FORTRESS

MATERIAL TRANSFER PROTOCOL – PHASE I

Document ref: FF-MTP-001

Document version: 1.0

Issued and effective date: 22 September 2026

PURPOSE

This Protocol sets out the process for making significant transfers during Phase I. It confirms the current route, records any restriction and creates a proportionate transfer record. The Phase I Provisioning Terms and Public Transparency Statement governs the legal effect of provision.

Identity disclosure is optional unless information is needed because of a concrete legal, sanctions, suspected criminal-property, fraud, error, technical or provider issue, or because the sender requests a restriction, special right or relationship that cannot be documented anonymously.

1. TRANSFER THRESHOLDS

Level	Amount	Process
Direct	Below £25,000	Use a current published route and retain the transaction reference. No routine pre-screening.
Documented	£25,000 to below £250,000	Contact Andrew Pletnev first. Confirm the amount, route, privacy preference and any condition in writing or secure message.
Strategic	£250,000 or more	For an arranged transfer, normally agree a short transaction-specific Provisioning Confirmation before sending. A test or staged transfer may be agreed.

Connected transfers from the same or associated source within 30 days are aggregated where the relationship between persons, wallets, accounts or transactions is known or reasonably apparent. Splitting or routing a transfer in parts does not avoid the applicable process.

Tier recognition follows the bands and currency shown on the provisioning page, subject to the Terms on current rights and discretionary future reciprocity. The transfer thresholds in this Protocol serve a different purpose and do not themselves create additional rights. Protocol thresholds use a reasonable sterling value recorded when arranging the transfer and checked against the actual resource received. Unsolicited receipts are assessed at receipt.

2. BEFORE A MATERIAL TRANSFER

- I. 1. Before a material transfer, contact Andrew Pletnev through a publicly displayed channel on the Frequency Fortress website and confirm the transfer destination.
- II. 2. State the proposed amount or resource, asset and network if relevant, timing, purpose, and any condition or expected right. Otherwise the provision is treated as unrestricted and subject to the current Terms and this Protocol. Verify the transfer details, as these may change.
- III. 3. Choose public, private, pseudonymous or anonymous Ledger presentation. Private identification remains optional except in the circumstances stated above.
- IV. 4. Frequency Fortress and the sender will record written or electronic acknowledgement of the applicable documents, intended route, status and any transaction-specific terms. An electronic message is sufficient unless a signed instrument is requested.

For a Documented or Strategic transfer, retain the written route confirmation and the versions of the Terms and this Protocol supplied or identified.

3. ACCEPTANCE RECORDS AND PROVISIONING CONFIRMATION

For a transfer of £25,000 or more, Andrew Pletnev records acceptance or other treatment in writing or electronically. Where the sender is in contact, confirmation is also communicated to them. The private Christed Vault Ledger records the amount or resource received, where known, together with the available receipt and acceptance dates, valuation basis, route, transaction reference, review level, restrictions, privacy preference and supporting evidence. Sender identity or chosen identifier, acknowledgement of the applicable Terms, and verified attribution are recorded separately and only where evidenced.

For an arranged transfer of £250,000 or more, a concise Provisioning Confirmation is normally agreed before transfer. It identifies the recipient, resource, document versions, any agreed restriction or express current right, and dated electronic or signed acknowledgements. The same form may be used below £250,000 if either side requests it. Unsolicited receipts follow Section 4. The absence of a pre-transfer form does not establish consent or automatically require a return.

Any public Ledger is a selective presentation derived from the private record. It may identify, pseudonymise, aggregate, delay or omit information according to the accepted privacy status, security, law and mission requirements.

4. RECEIPT RECORDING AND ERRORS

A resource is received when it becomes controllable through the confirmed account or wallet. It is recorded as provision unless it is identified as mistaken, unsupported, unlawful, subject to unresolved conditions or otherwise unsuitable for deployment. The private Christed Vault Ledger or associated accounting record will record the available transaction evidence and privacy status.

An unidentified or unsolicited transfer may remain unassigned while its treatment is assessed. Subject to applicable law and concrete concerns, Andrew Pletnev may accept an anonymous receipt as mission support without named attribution. Receipt or acceptance does not prove the sender agreed to the Terms or establish a special right. A later claimant must provide proportionate evidence linking them to the transfer before relationship-based access or reciprocity can be considered; public anonymity may be preserved. Any later agreement applies on the basis it states and does not imply that the sender consented earlier.

A person claiming mistake or unauthorised transfer must contact Frequency Fortress promptly and provide sufficient evidence to identify the transaction and establish authority over the funds. Frequency Fortress may require security checks and may issue a return only through a route that it considers lawful and technically safe. No return is promised where it is unlawful, impossible, unsafe, unsupported or claimed by a person who cannot establish authority.

Where lawful, a return may be reduced by reasonable, unavoidable costs directly attributable to that particular return, with the basis and amount recorded and communicated where possible. General tax liabilities or open-ended professional costs are not automatically charged to the sender; responsibility for the underlying error must be taken into account.

5. OPERATIONAL SAFEGUARDS

- Use only the asset, network, account or wallet confirmed before initiating the transfer. Reconfirm any revised instructions before sending. A later route change does not retrospectively invalidate a transfer already initiated in accordance with confirmed instructions.
- Do not send unsupported tokens, NFTs, bridged assets, locked assets, leverage positions, credentials or physical goods without prior confirmation.
- Frequency Fortress may decline a route because of technical, custody, sanctions, fraud, security, banking, exchange, tax, accounting or operational concerns.
- The sender is responsible for following confirmed instructions and accurately executing the transfer. This does not exclude responsibility for incorrect instructions supplied by Frequency Fortress or liability that cannot lawfully be excluded.
- Frequency Fortress may pause, decline or return a transfer where a concrete legal, sanctions, suspected criminal-property, fraud, error, technical or provider issue requires it.

6. CONTACT AND STATUS VERSION

Mission and provisioning enquiries: st69.ops@protonmail.com

Legal and media enquiries: st69.contact@protonmail.com

This Protocol takes effect only once approved and published with an effective date. The version supplied and agreed before initiation governs an arranged transfer, subject to any expressly agreed variation. Later publication or acknowledgement does not retrospectively establish consent to an earlier transfer. The Terms govern legal effect and mandatory-law safeguards.
